                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                               Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents the Surface layer (S-layer) protein from R. prowazekil strain Broinl. This sequence is useful for vaccination against typhus and spotted fever rickettsial infection or for diagnosing diseases caused by these bacteria. The surface layer protein antigens can be produced recombinantly in large quantities.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ||:|||||||

                        The alkaline phosphatase (AP) (AAW17830) of Rhodothermus marinus (Rma) has a high pH optimum (10.8) and is thermostable, retaining 60% of its activity after 24 hr at 65 deg. It is also tolerant of other denaturing conditions, such as overnight incubation in 6 M urea at 65 deg. Recombinant AP can be produced in transformed host cells utilising isolated nucleotide sequences (see also AAT66461-63). The properties of the enzyme make it suitable for

                                                                                                                                                                      AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, crythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-NOV-1998;
21-NOV-1997;

                                                                                                                                                                                                                          Sequencing of the p120 gene showed an ORF starting with ATG at position 226. The ORF has 3900 bp which encode 1300 amino acids resulting in a protein with deduced mol.wt. of 132.611 kb. The amino acid sequence has 31 potential N-glycosylation sites. The other ORF of 726 bp was found about 100 bp downstream and on the opposite strand of the p120 gene. Between the two ORF's is the 106 bp intergenic region which presumably serves as a transcriptional termination site.

The recombinant protein can be used to vaccinate humans against RMSF. The DNA can be used as a hybridisation probe for diagnosis of RMSF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gilmore RD,

The C. glutamicum SMP gene can be used in vectors CC (II) for expression in host cells and production or modulation of cromongrotelinogenic antino acid (preferred), a purine or pyrimidine base, CC or nonproteinogenic antino acid (preferred), a purine or pyrimidine base, CC coloctor, a polyketide, or an eromatic compound, a vitamin, a coffictor, a polyketide, or an eroxyme. The presence of (I) or SMP proteins CC coffictor, a polyketide, or an eroxyme. The presence or activity of CC corpobacterium diphtheriae in a subject. (I), (II), (III) or host cells containing them are used for diagnosing the presence or activity of CC containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms related to containing them are used to map genomes of organisms required containing in modulating SMP protein regions required the metabolism of sugars, and in modulating high-energy molecule production containing in sugars, and in modulating high-energy molecule production

                                                                                                                                                                                                                                                                                        The present sequence represents a cytochrome P450 monooxygenase from Sorghum bicolor (L.) Moench, designated P450ox. Cytochrome P450 monooxygenase catalyses: (1) the conversion of aldoxime to a nitrile; and (ii) the nitrile to the corresponding cyanohydrin. DNA encoding cytochrome P450 monooxygenase can be used to obtain transgenic plants, for the purpose of improving the nutritive value or pest resistance of the plant. Cytochrome P450 monooxygenase catalyses the conversion of aldoximes to nitriles to cyanohydrins, which are the precursors of toxic cyanogenic glycosides, so staple food such as cassava and ilma beans, as well as animal feed such as white clover, can be rendered less toxic by blocking the cytochrome P450 monooxygenase activity. Introducing the enzyme to plants or to certain tissues could help reduce crop damage since the product is also toxic to insects, acarids and nematodes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Cytochrome P450 monooxygenase; P450ox; Sorghum bicolor (L.) The sequences can be used for determining CC the presence of or predisposition to, or preventing or treating CC pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy CC vectors. The proteins and nucleic acids may be used to treat concers, CC proliferative disorders, neurodegenerative disorders, osteoarthritis, CC graft vs host disease, cardiovascular disease, diabetes mellitus, hypothyroldism, cholesterol ester storage, systemic lupus criterias and intertion, malaria, autoimmune disorders, asthma, calletrias and intertion, malaria, autoimmune disorders, asthma, burner symples hore and cartillar damage.

                                                                                                                                    CC A method has been developed for: (a) differentiating animals and animal CC products according to breed origin; (b) determining or testing the breed CC origin of a product; or (c) validating an animal product. The method CC comprises analysing a sample of the product for the allele(s) of at CC least one breed-determinant (BD) gene. The present invention also CC describes: (1) methods for determining the coat colour genotype of a pig CC hormone receptor (alpha-MSHR) gene; (ii) the amino acid sequence of an CC alpha-MSHR protein at positions associated with coat colour, or the size of the protein; (iii) detecting which microsatelites (or other linked CC marker alleles), linked to the alpha-MSHR gene, or particular alleles of it, are present; and (iv) analysing nucleic acid to determine if the KIT CC gene carries a polymorphism associated with the Belt genotype. The cC mammals, especially pigs, Particular applied to samples from fish, birds and CC mammals, especially pigs, Particular applications are confirming stated CC origin of meats; in quality control; for maintaining stock purity, and CC in the confirment control; for maintaining stock purity, and CC quickly and inexpensively. The process can be made quantitative. The present sequence represents a partial protein sequence of alpha-MSFR CC from a Hampshire breed pig.

                              cc products according to breed origin; (b) determining or testing the wide configuration of a product, or (c) validating an animal product. The method cc comprises analysing a sample of the product for the allele(s) of at CC least one breed-determinant (BD) gene. The present invention also consists one breed-determinant (BD) gene. The present invention also consists one breed-determinant (BD) gene. The present invention also consists of the supha melanocyte-stimulating controls are consisted for determining the coat colour genotype of a pig commone receptor (alpha-MSHR) gene; (ii) the amino acid sequence of an common acid sequence of an comparation acid sequence of an alpha-MSHR gene, or particular alleles of the protein; (iii) detecting which microsatellites (or other linked common acid sequence of an acid sequence of an acid sequence of an common acid sequence of an acid sequence of acid sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
CC A method has been developed for: (a) differentiating animals and animal products according to breed origin; (b) determining or testing the breed origin of a product; or (c) validating an animal product. The method comprises analysing a sample of the product for the allele(s) of at least one breed-determinant (BD) gene. The present invention also describes: (l) methods for determining the coat colour genotype of a pig by determining; (i) the allele(s) of the alpha melanocyte-stimulating by determining; (i) the allele(s) of the alpha melanocyte-stimulating alpha-MSHR protein at positions associated with coat colour, or the size of the protein; (iii) detecting which microsatellites (or other linked marker alleles), linked to the alpha-MSHR gene, or particular alleles of the are present; and (iv) analysing nucleic acid to determine if the KIT gene carries a polymorphism associated with the Belt genotype. The main method of the invention is applied to samples from fish, birds and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               88888888888888.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
            A method has been developed for: (a) differentiating animals and animal products according to breed origin; (b) determining or testing the breed origin of a product; or (c) validating an animal product. The method comprises analysing a sample of the product for the allele(s) of at least one breed-determinant (BD) gene. The present invention also describes: (1) methods for determining the coat colour genotype of a pig by determining; (i) the allele(s) of the alpha melanocyte-stimulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Porcine; wild boar; meishan; pietrain; large white; hampshire; duroc; differentiation; breed origin; alpha-MSHR; coat colour; stock purity; alpha melanocyte-stimulating hormone receptor; KIT.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          mammals, especially pigs. Particular applications are confirming stated origin of meats; in quality control; for maintaining stock purity, and in breeding programmes (to confirm particular crosses). The method requires only very small samples and many samples can be screened quickly and inexpensively. The process can be made quantitative. The present sequence or alpha-MSFR from wild boar.
                                                                                                                                                           Differentiating products from different animal breeds - by the analysis of alleles of breed-determinant genes, at the nucleic or protein level

The main method of the invention is applied to samples from fish, birds and mammals, especially pigs. Particular applications are confirming stated origin of meats; in quality control; for maintaining stock purity, and in breeding programmes (to confirm particular crosses). The method requires only very small samples and many samples can be screened quickly and inexpensively. The process can be made quantitative. The present sequence represents a partial protein sequence of alpha-MSFR from a Meishan breed pig.

N.B. The present sequence is said to be encoded by AAV80682, but does not a mean to do so
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Porcine; wild boar; meishan; pietrain; large white; hampshire; duroc; differentiation; breed origin; alpha-MSHR; coat colour; stock purity; alpha melanocyte-stimulating hormone receptor; KIT.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cc origin of a product; or (c) validating an animal product. The method cc comprises analysing a sample of the product for the allele(s) of at cleast one breed-determinant (BD) gene. The present invention also cc describes: (1) methods for determining the coat colour genotype of a pig CC by determining; (i) the allele(s) of the alpha melanocyte-stimulating CC by determining; (ii) the allele(s) of the alpha melanocyte-stimulating CC alpha MSHR protein at positions associated with coat colour, or the size of the protein; (iii) detecting which microsatellites (or other linked CC marker alleles), linked to the alpha-MSHR gene, or particular alleles of it, are present; and (iv) analysing nucleic acid to determine if the KIT gene carries a polymorphism associated with the Belt genotype. The CC mammals, especially pigs. Particular applications are confirming stated CC origin of meats; in quality control; for maintaining stock purity, and in breeding programmes (to confirm particular crosses). The method CC origin of meats; want is amples and many samples can be screened CC quickly and inexpensively. The process can be made quantitative. The present sequence represents a partial protein sequence of alpha-MSFR CC from a Large White breed pig.

CC N.B. The present sequence is said to be encoded by AAV80684, but does on the sequence of alpha-MSFR control of the present sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the sequence is said to be encoded by AAV80684, but does on the seque

::
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                     Score

A; Residues: 33-177, 'VC', 180-190, 'INSRSSSYHLVS', 202-211, 'I', 213-256, 'A', 258-312, 'L', 314-1
A; Cross-references: GB:M37647; NID:g152497; PIDN:AAA26390.1; PID:g152498
A; Note: the authors translated the codon AAT for residue 146 as Ala, CGT for residue 478
5 is inconsistent with the translation of the nucleotide sequence
A; Note: parts of this sequence were determined by protein sequencing

Plant Mol. Biol. 36:393-405(1998).

-I- FUNCTION: CATALYZES THE CONVERSION OF P-HYDROXYPHENYLACETALDOXIME

TO P-HYDROXYMANDELONITRILE. THE DEHYDRATION OF THE OXIME TO THE

CORRESPONDING NITRILE IS FOLLOWED BY A C-HYDROXYLATION OF THE

NITRILE TO PRODUCE P-HYDROXYMANDELONITRILE.

-I- PATHWAY: BIOSYNTHESIS OF THE CYANOGENIC GLUCOSIDE DHURRIN.

-I- SUBCELLULAR LOCATION: MEMBRANE-BOUND. ENDOPLASMIC RETICULUM
                                                                         Submitted (JUN-1999) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: CATALYZES AN AMIDOTRANSFERASE REACTION THAT GENERATES IMIDAZOLE-GLYCEROL PHOSPHATE AND 5-AMINOIMIDAZOL-4-CARBOXAMIDE RIBONUCLEOTIDE, WHICH IS USED FOR PURINE SYNTHESIS.

-!- FUNCTION: CATALYZES THE CYCLIZATION REACTION THAT PRODUCES D-ERYTHRO-IMIDAZOLE GLYCEROL PHOSPHATE.

-!- PATHMAY: FIFTH AND SIXTH STEPS IN HISTIDINE BIOSYNTHETIC PATHMAY.
-!- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE HISH FAMII-1- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE HISH / HIS
